01.10.2022 – 30.09.2025

Metrology for Earth Biosphere: Cosmic Rays, Ultraviolet Radiation and Fragility of Ozone Shield

F. Krasniqi (PTB), Coordinator

The project 21GRD02 BIOSPHERE has received funding from the European Partnership on Metrology, co-financed by the European Union's Horizon Europe Research and Innovation Programme and by the Participating States.

Solar Particle
Events

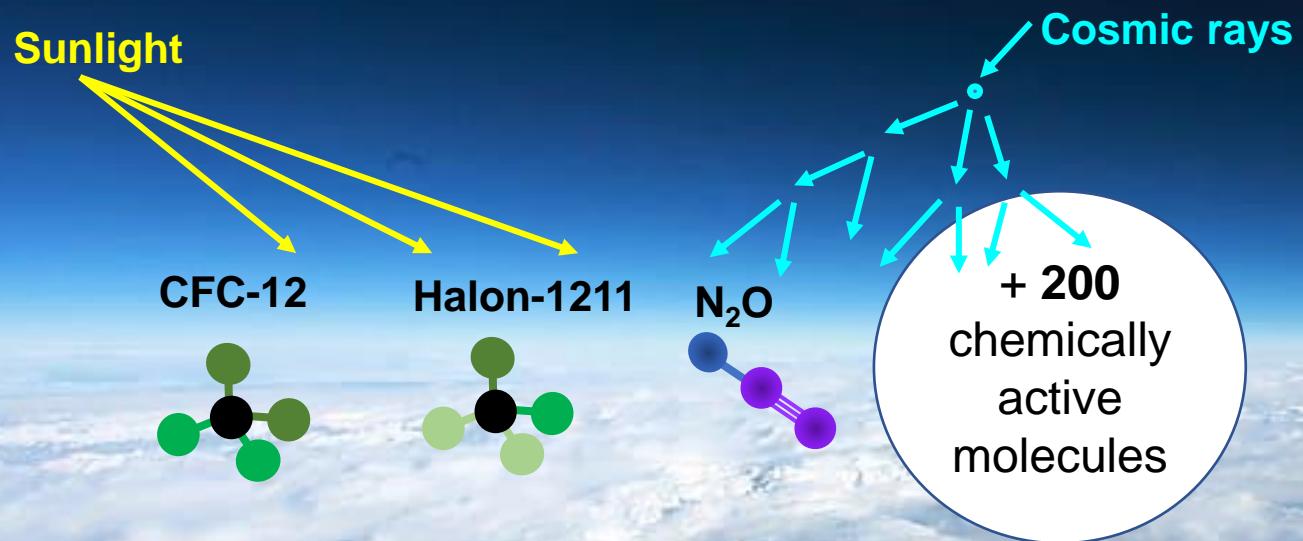

UV radiation

Cosmic rays and solar UV
radiation are the main sources
of atmospheric ionization

Implications for the
climate and health

Need: Ozone chemistry

Formation of free radicals in the atmosphere

Cl⁻, Br⁻, NO⁻ radicals can destroy up to 100 000 ozone molecules!

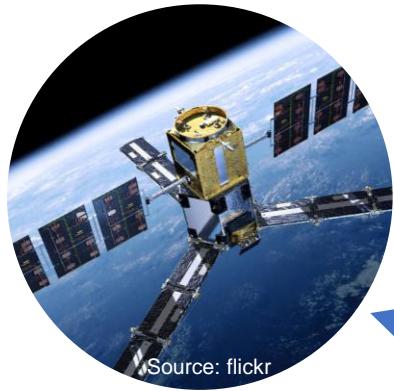

**Lifetime of ozone-depletion molecules up to 4 000 years!
E.g., CFC-12: 102 years**

Depletion of ozone shield leads to an increase of biologically active UV radiation.

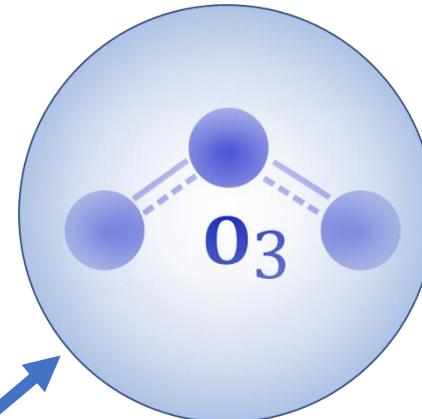

UVB radiation overexposure

Need: Metrology for the Earth biosphere

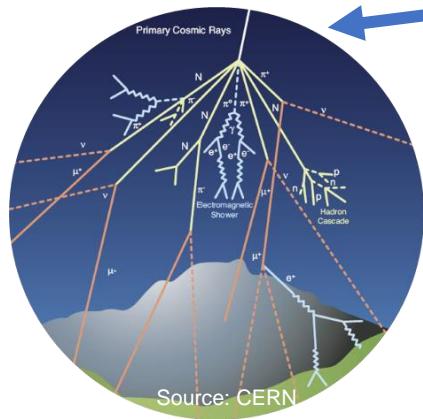

Extraterrestrial radiation in space

- Solar particle events
- Galactic cosmic rays
- Solar radiation

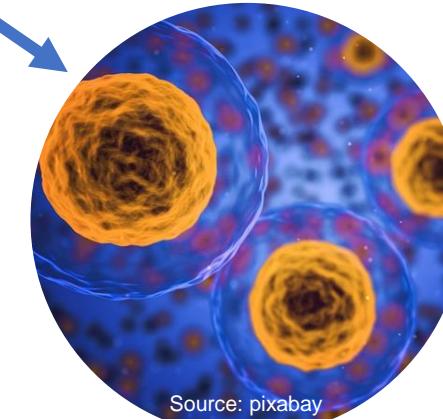

Atmospheric chemistry

- Anthropogenic activities
- Ionization
- Molecular dissociation
- Ozone depletion

Extraterrestrial radiation on the ground

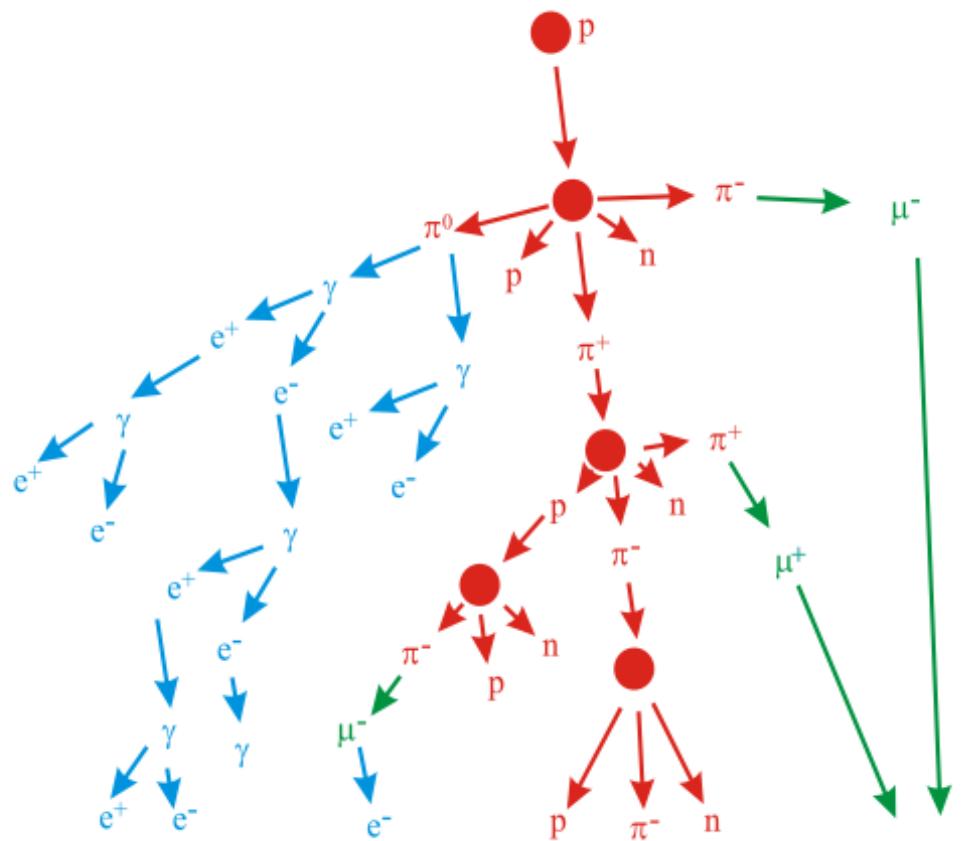

- Muons
- Neutrons
- UVB radiation

Biology

- DNA damage
- Genomic instability
- Cell death

WP1: Instrumentation for determining the dependence of SCR on PCR and atmospheric parameters

LIDAR**

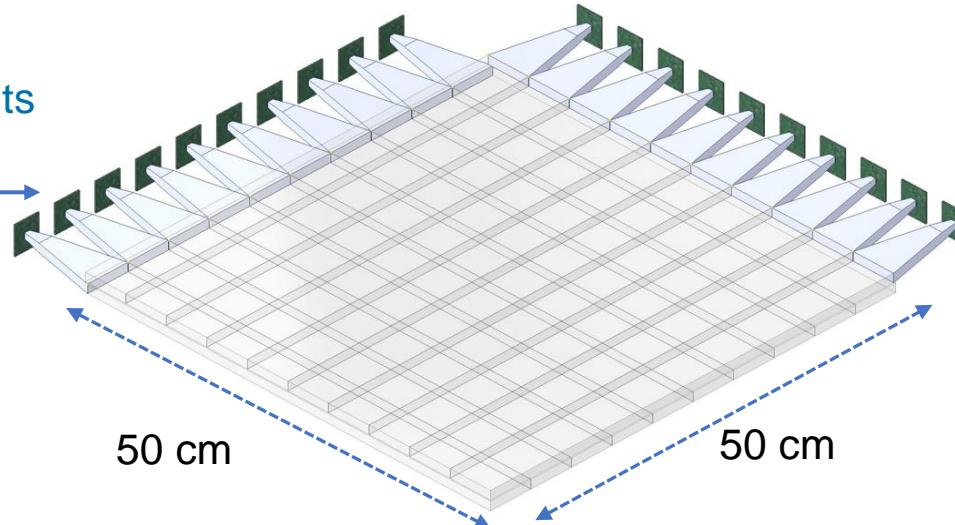

**WP 1 Leader:
B. Rapp**

WP1: Instrumentation for determining the dependence of SCR on PCR and atmospheric parameters

Novel detector for cosmic muons

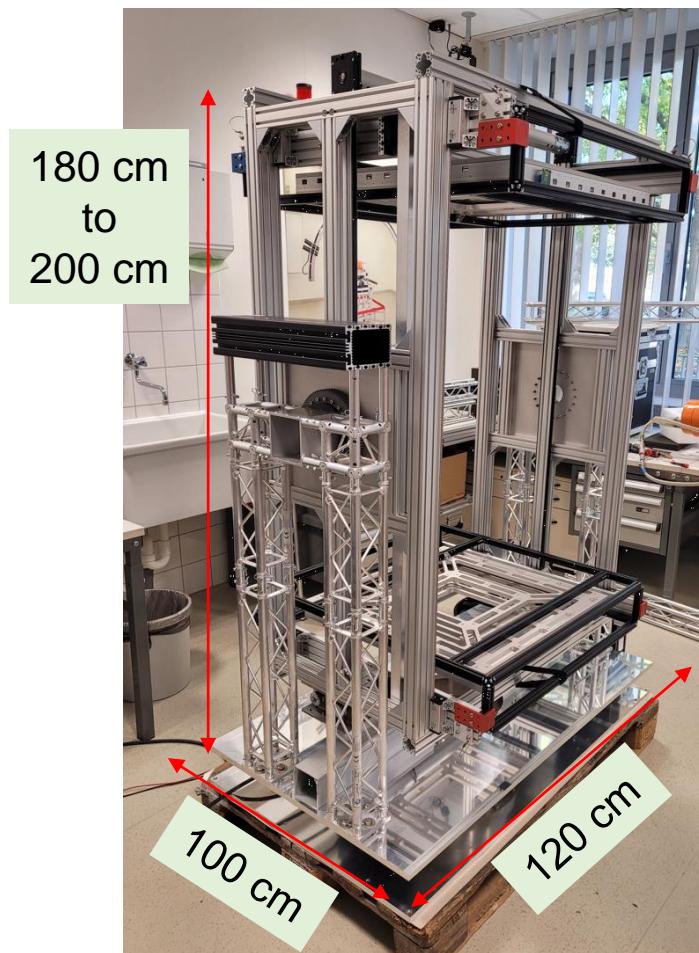

- Solid angle adjustment ($\Omega/(2\pi)$: 0.1 to 0.6)
- Angular distribution of muons (θ : 0° to 90°, φ : 0° to 360°)
- Pixelated (5 x 5 cm²)
- Mobile

Differential elastic electron scattering cross sections of ethanol (renewable biofuel)

Biofuels such as ethanol are increasingly replacing traditional fossil fuels, which leads to an elevation of volatile organic compounds in the earth atmosphere.

- Elastic electron scattering cross sections of ethanol have been measured und submitted for publication (accepted)
- Total ionization cross sections of ethanol have been calculated

PTB: M. Dinger, W. Y. Baek

Experiments @ PTB Ion Accelerator Facility (July 2023)
Simulate CR-Muons with low LET-protons

Protons of 10 MeV to 15 MeV
 LET \sim 4 keV/ μ m

Solar Simulator based on 300 W Xe short arc lamp

PTB Team:

U. Giesen (Department 6.4)

F. Krasniqi (Department 6.3)

with assistance from
 Working Group 4.11: Spectroradiometry

WP1: The cosmic ray detectors are being characterized metrologically.

WP2: The first measurement campaign to quantify the relationships between cosmic rays, UV-B radiation and the thickness of the ozone layer and the concentration of anthropogenic gases is in preparation. It will start on 01 June 2023.

WP3: Elastic electron scattering cross sections of ethanol were measured and submitted for publication (accepted). Fragmentation cross sections of 6 ozone depleting molecules have been measured (measurements with other molecules are ongoing).

WP4: Experiments at PIAF with human primary cells are in preparation. The first beam time is planned for July 2023.
